

Second Pass: Beat the Machine, a Facilitator's Guide

Forty minutes for a chapter meeting, a classroom or a firm's staff training. Version 2.1, 13 September 2026, against halyard-v4, brightwater-v5, product 1.6.1. Long version: FACILITATOR-GUIDE.md.

What you need, and what to do first

- The link, <https://fiscalpatriots.github.io/beat-the-machine/>, and a phone or laptop each. The header carries Drill, Checker and Review, so no URL is read aloud.
- The response sheet, if you want numbers. Rounds post to a Google Form you must own to read. Without it, take a show of hands. Walk it yourself first in test mode, ?test=1, which posts nothing.
- Read the data notice rather than talking over it, and say pseudonymous. The chips include Professor and Outside Mason.

The session plan

Minutes	Segment	What happens
5	Framing	A built case carrying the mistakes an AI assistant makes. Read the threshold rule aloud: above both \$25,000 and 10 percent. Name no error types.
12	Play	The ledger alone first, tapping every line worth a second look, then the fourteen Halyard lines, alone, par ten minutes, no question about a line answered.
3	Fresh case	Five lines of a dental group nobody has seen: no reveal, no score, no track. Say only what the bridge screen says.
15	Debrief	The six questions below, two answers each, then three minutes on the reason.
5	Close	The numbers back, the voluntary send, and the argument: four checks recompute and two stay with a person.

The two-step lock, and the reason score

The player calls the line, the buttons become a chip row, and no reveal comes until a chip is tapped. Say that in the framing. The chips: figure does not tie, direction wrong, no source on file, wrong period, wrong account, nothing written where owed, and on a stand, the figure and reason hold. Each card carries a key of the chips that fit it, so a reason scores right when one tapped chip is in the key and none is outside it. The end screen prints the call score beside the reason score. The badges read the calls alone, an agreeing reason adds points toward the rank, and the reason score tests the stated basis for contradiction rather than proving anybody reasoned.

The debrief, six questions in order

Ask the room	Type and lines	The tell
Which figures did not tie?	Arithmetic, 1 and 8	Check the number against the ledger before you read the reason attached to it.
Which sentence runs backwards?	Wrong direction, 3	The memo said declined beside a June balance higher than May's.
Which two sentences cannot both be true?	Timing, 2	The same program is finished on June 30 and still running into August, and neither says what June work was performed.
Which reasons sounded specific and rested on nothing?	Unsupported driver, 7 and 14	Ask what document would prove it. On 14 it points at depreciation, which never moved.
Where is a movement credited to a cause nobody documented?	Unsupported attribution, 12	Continued demand is a claim about customers, and no billing bridge is on file.
Which account owed an explanation and got none?	No explanation, 11	Read the ledger for what the memo left out, not only for what it got wrong.

Then three minutes on the reason. Ask which chip they tapped, type by type, and put the key beside it: 1 and 8 figure does not tie, 3 direction wrong, 2 wrong period, 11 nothing written where owed; no source on file rides with all of those except 1 and stands alone on 7, 12 and 14; clean lines take the figure and reason hold. Watch for a right call through the wrong finding, a defect chip on a line they let stand, and no source on file tapped everywhere.

Reading the response sheet in five minutes

Run findings.py against the downloaded responses and fill READOUT-TEMPLATE.md, or take four by hand: call accuracy on the eight problem lines, 1, 2, 3, 7, 8, 11, 12 and 14; false flags on the six clean lines; reason accuracy from Reason: agrees. in each Why cell; the fresh case from question C. Card one is inverted, so flagging 4200 posts Reject. Drop test rows, count attempts rather than rows, read only the first attempt under each codename, and never report codenames as people.
